"Complete cDNA sequence of murine cytoplasmic dynein heavy chain.";

Submitted (JUL-2000) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: DYNEIN HAS ATPASE ACTIVITY. CYTOPLASMIC DYNEIN ACTS AS

MOTOR FOR THE INTRACELLULAR RETROGRADE MOTILITY OF VESICLES AND

MOTOR FOR THE INTRACELLULAR RETROGRADE MOTILITY OF VESICLES AND

MOTOR FOR THE INTRACELLULAR TOO HEAVY CHAINS AND A NUMBER OF

INTERMEDIATE AND LIGHT CHAINS.

-!- SUBCELLULAR LOCATION: CYTOPLASMIC.

DISEASE: DEFECTS IN CPS1 ARE THE CAUSE OF AN AUTOSOMAL RECESSIVE
METABOLIC DISORDER THAT CAUSE A TYPE OF HYPERAMMONEMIA. CLINICAL
SYMPTOMS ARE VOMITING IN INFANCY, PROTEIN INTOLERANCE,
INTERMITTENT ATAXIA, SEIZURES, LETHARGY, AND MENTAL RETARDATION.
SIMILARITY: TO OTHER CARBAMOYL-PHOSPHATE SYNTHETASES. ALSO
CONTAINS A GLUTAMINE AMIDOTRANGFERASE-LIKE DOMAIN BUT THE CYSTEINE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CATALYTIC ACTIVITY: 2 ATP + NH(3) + CO(2) + H(2)O = 2 ADP ORTHOPHOSPHATE + CARBAMOYL PHOSPHATE.

FUNCTION: NUCLEAR

BUT

NON

COVALENTLY LINKED COMPLEX WITH THE C-JUN/AP-1 TRANSCRIPTION FACTOR. C-FOS HAS A CRITICAL FUNCTION IN REGULATING THE DEVELOPMENT OF CELLS DESTINED TO FORM AND MAINTAIN THE SKELETON. IT IS THOUGHT TO HAVE AN IMPORTANT ROLE IN SIGNAL TRANSDUCTION, CELL PROLIFERATION AND DIFFERENTIATION (BY SIMILARITY).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to truncated VRP (vascular endothelial growth CC factor (VEGF)-related protein) subunits that have at least one amino CC acid N-terminal to the first Cys of the core sequence deleted. Host CC calls transformed or transfected with expression vectors containing CC nucleic acids encoding the truncated VRP subunits are used to produce CC the truncated proteins recombinantly. The truncated VRP subunits, CC optionally expressed from gene therapy vectors, have in vivo and in vitro CC angiogenic activity and are used to stimulate angiogenesis, particularly CC coronary collateral vessel development in cases of cardiac ischaemia; to CC stimulate endothelial cell growth and migration in vitro; to treat heart CC lower limb ischaemia; stroke and peripheral vascular disease; to treat ischaemia (e.g.cardiac, chronic coronary or chronic CC lower limb ischaemia; stroke and peripheral vascular disease); to promote healing of wounds (of skin or intestines), and to increase vascular CC permeability. Sequences AAW86234 to AAW86239 represent full length VRP cc sequences from which the truncated fragments are created.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              protein (fik-lbp) (see AAWI1837) that binds to the receptor tyrosine kinase fik-l expressed on vascular endothelial and other cells. The mature fiki-bp can be secreted from host cells transformed with an expression vector including an isolated fik-bp cDNA clone (see AAT68811). Fik-lbp can be used to isolate cells to which it binds, for use in studying the roles of such cells and of fik-l in vasculogenesis and angiogenesis. Angiogenesis inhibition or increased vascularisation may be clinically desirable (e.g. to suppress solid tumour growth or in wound healing, respectively). The fik-lbp can be administered to treat conditions with defective or insufficient fik-l. Polypeptides may also act as carriers to deliver diagnostic/therapeutic agents to cells to which fiki-bp binds, to generate antibodies, and to identify fik-lbp antagonists useful for treating fik-lbp mediated conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                             This polypeptide comprises the pre-pro sequence of human VEGF-C, a novel ligand that binds specifically to human Flt4 receptor tyrosine kinase (VEGER-3), stimulating phosphorylation of the receptor. Its sequence was deduced from a cDNA clone (AAT84276) obtd. from a PC-3 prostatic adenocarcinoma cell (AFCC CRL 1435)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 7; Page 112-113; 183pp; English.

It is postulated to be a third member of the VEGF protein family. Its amino acid sequence was deduced from a cDNA clone (AAT59929) obtd. from a glioma 661 library. Recombinant VRF can be produced in transformed host cells and used: to promote growth of vascular and
                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                             with excessive neovascularisation or vascular permeability. may make it possible to avoid coronary by-pass surgery by stimulating growth of the collateral circulation.

                                                                                                                                                                                  mitogen for vascular endothelial cells, stimulating their growth and angiogenesis. The amino acid sequence of VEGF2 was deduced from a cDNA clone (AAT51371) obtd. from an early stage human (week embryo cDNA library. VEGF2 polypeptides can be produced in transformed host cells and used to promote angiogenesis e.g., to stimulate the growth of transplanted tissue following coronary bypass surgery, or to promote endothelialisation in vascular graft surgery. It can also be used to screen for antagonists (useful e.g. for tumour therapy) and agonists of VEGF2 activity.

                                                                                                                                                                                                                                 angiogenesis, for stimulating lymphangiogenesis, treatment or prevention of inflammation, oedema, elephantiasis, or Milroy's disease. They can also be used to modulate myelopolesis, e.g. treating granulocytopenia. They can also be used for modulating the growth of endothelial cells. They can also be used for modulating the growth of endothelial cells. They can also be used to stimulate lymphocyte production and maturation, and to promote or inhibit trafficking of leucocytes between tissues and lymphatic vessels or to affect migration in and out of the thymus.
                                                                                                                                                                                                                                                                                                                                                       The vascular endothelial growth factor C (VEGF-C) polypeptides have activities affecting growth and migration of vascular endothelial cells, promoting growth of lymphatic endothelial cells and lymphatic The increasing vascular permeability, and affecting myelopoiesis. The products can be used for stimulating angiogeneses, for inhibiting

                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         products can be used for stimulating angiogeneses, for inhibiting angiogenesis, treatment or prevention of inflammation, oedema, elephantiasis, or Milroy's disease. They can also be used to modulate myelopoiesis, e.g. treating granulocytopenia. They can also be used for modulating the growth of endothelial cells. They can also be used for modulating the growth of endothelial cells. They can also be used to stimulate lymphocyte production and maturation, and to promote or inhibit trafficking of leucocytes between tissues and lymphatic vessels or to affect migration in and out of the thymus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The vascular endothelial growth factor C (VEGF-C) polypeptides have activities affecting growth and migration of vascular endothelial cells, promoting growth of lymphatic endothelial cells and lymphatic vessels, increasing vascular permeability, and affecting myelopoiesis. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents vascular endothelial growth factor-2 (VEGF-2). The VEGF-2 polypeptides have activities similar to VEGF. The VEGF-2 polypeptides stimulate the growth of vascular endothelial cells, stimulate endothelial cell migration, stimulate angiogenesis, decrease blood pressure, and increase blood flow. The polynucleotides and polypeptides can be used for preventing, treating or ameliorating a medical condition. The VEGF-2 polypeptides or polynucleotides may be useful in treating deficiencies or disorders of the immune system, by
                                                                                                                                                                                                   useful in treating deficiencies or disorders of the immune system, by activating or inhibiting the proliferation, differentiation, or mobilization (chemotaxis) of immune cells. The etiology of these immune deficiencies or disorders may be genetic, somatic, such as cancer or some autoimmune disorders, acquired (e.g. by chemotherapy or toxins), or infectious. Examples of immunologic deficiency syndromes include blood protein disorders, ataxia telangiectasia, common variable immunodeficiency, Digeorge syndrome, HIV infection, HTLV-BLV infection, leukocyte adhesion deficiency syndrome, lymphopenia, phagocyte bactericidal dysfunction, severe combined immunodeficiency (SCIDs),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        vascular endothelial cell growth; endothelial cell migration; angiogenesis; blood pressure; blood flow; immune system disorder; immune cell; cancer; autoimmune disorder; blood protein disorder; ataxia telangiectasia; common variable immunodeficiency; Digeorge syndrome; HIV infection; HTLV-BLV infection; leukocyte adhesion deficiency syndrome; lymphopenia; phagocyte bacterioldal dysfunction; severe combined immunodeficients; blagocyte bacterioldal dysfunction; severe combined immunodeficients; blood protein disorder; blood protein disord

The invention provides truncated VRP (VEGF-related protein) submits that have at least one amino acid N-terminal to the first Cys of the core sequence deleted. Host cells transformed or transfected with expression vectors containing nucleic acids encoding the truncated VRP submits are used to produce the truncated proteins recombinantly. The truncated VRP submits, optionally expressed from gene therapy vectors, have in vivo and in vitro anglogenic activity and are used to stimulate anglogenesis, particularly coronary collateral vessel development in cases of cardiac ischaemia; to stimulate endothelial cell growth and migration in vitro; to treat heart disease; to treat inchesis (or activity and are used to stimulate anglogenesis).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and antidiabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful

It was used to demonstrate the methods of the invention, which involve the screening of individuals to determine which vascular endothelial growth factor receptor 3 (VEGFR-3, also known as Fit4 or fms-like tyrosine kinase 4) alleles they possess and thus their likelihood of developing hereditary lymphoedema. Conditions associated with lymphoedema include Milroy Nonne syndrome, which is early onset lymphoedema and lymphoedema praecox, which is late

                                                                                                                                                                                                                                                The patent discloses a method to treat neoplastic disease characterised CC by expression of fms-like tyrosine kinase 4 (Flt4) receptor (also CC referred as vascular endothelial growth factor receptor-3, VEGFR-3) in CC endothelial cells of blood vessels adjacent to malignant neoplasm. The CC method involves administering a compound that inhibits binding of a CC ligand to Flt4 thereby inhibiting Flt4 mediated proliferation of vascular cc endothelial cells. The compound is useful for treating neoplastic disease CC such as breast carcinomas, squamous cell carcinomas, lymphomas, melanomas and sarcomas. Flt4 receptor tyrosine kinase binding compounds can be used CC for manufacturing medicament useful for diagnostic screening, imaging and CC treatment of malignancies characterised by Flt4-expressing blood cells. CT file Flt4 gene maps to chromosomal region 595 and is expressed as 5.8 kb CC and 4.5 kb mRNAs which differ in their 3, sequences and are CC differentially expressed in HEL and DAMI cell lines. Flt4 CC used as a target for tumour imaging and anti-tumour therapy. CC The present sequence is a human prepro-vascular endothelial growth CC factor C (VEGF-C), a specific example of Flt4 binding compound.
